SUMMARY

Software Engineer specializing in Java/Spring Boot microservices with end-to-end SDLC ownership — secure design, TDD/BDD, CI/CD (Jenkins/Maven), and production support in the consumer banking domain. Experienced building scalable distributed systems, Kafka-driven event pipelines, RESTful APIs with RBAC, and GenAI/LLM automation. Strong collaborator across globally distributed Agile/Scrum teams spanning DevOps, QA, and architecture.

EDUCATION

Chaitanya Bharathi Institute of Technology, Hyderabad — B.E. Computer Science & Engineering 2021 – 2025

EXPERIENCE

Citizens GCC | Software Engineer I (via Cognizant Technology Solutions)

May 2025 – Present

- Own end-to-end SDLC for consumer banking services — requirements gathering, Spring Boot microservice design, JUnit 5 unit and integration testing, code review, and production support; collaborate cross-functionally with DevOps, QA, and architecture in a globally distributed Agile/Scrum environment to deliver reliable, user-facing improvements.
- Enforce secure coding practices (OWASP input validation, JWT/OAuth2, secrets management, least-privilege RBAC) across 5+ microservices; design and consume RESTful APIs protecting sensitive transactional data; remediate vulnerabilities via SonarQube-guided PR reviews on every commit.
- Integrate GenAI and LLM APIs via prompt engineering to automate code review, JUnit test-case generation, and CI/CD pipeline summarization — reducing manual engineering effort by ~25% and accelerating 2-week sprint release cycles.
- Automate CI/CD pipelines (Jenkins, Maven, Git, GCP Cloud Build) with feature-flag rollouts, cutting deployment time by 40%; maintain Prometheus/Grafana observability with OpenTelemetry distributed tracing, sustaining 99.9% uptime SLA.

PROJECTS

AI-Powered Fraud Detection & Real-Time Alerting System

Spring Boot · Kafka · ML Anomaly Detection · Kubernetes · Prometheus · Grafana · OpenTelemetry · GCP (BigQuery, Dataflow)

- Built an end-to-end Spring Boot ETL pipeline processing 100K+ transactions/min — ingesting raw Kafka event streams with consumer-group partitioning, transforming via a hybrid ML anomaly detection engine with rule-based filters, and loading structured risk signals to GCP BigQuery; Prometheus alerting reduced false positives by ~30%.
- Deployed on Kubernetes with horizontally auto-scaling stateless services and Grafana dashboards for live monitoring; Saga/Outbox patterns guaranteed exactly-once event delivery under high-throughput conditions.
- Designed Kafka dead-letter queues (DLQ) for fault isolation; DLQ replay ensured zero missed fraud signals during downstream outages and schema-migration windows, meeting financial-grade reliability SLAs.

PillPrice — Medicine Price Comparison Platform

Next.js · React · TypeScript · Prisma · PostgreSQL · Tailwind CSS · Edge Runtime · Zod

- Built a production full-stack application aggregating pharmacy pricing data across multiple sources with location-aware ranking, achieving sub-200ms P95 API response times under real user load.
- Designed server-side search and scraping APIs backed by Prisma ORM and PostgreSQL (normalized schemas, indexed relationships, idempotent upsert flows); SQL query optimization reduced average query latency by 35%.
- Enforced end-to-end type safety with TypeScript and Zod schema validation; modular API routes and reusable React components cut feature delivery time by 30%, with stale-while-revalidate caching absorbing read-heavy traffic.

AI-Powered News Aggregator & Conversational Summarization Engine

LLM APIs · Prompt Engineering · Python · Azure · GCP (Pub/Sub, Cloud Storage) · NLP · OpenTelemetry · GitHub Actions

- Architected a GenAI ETL platform with a modular NLP pipeline for automated topic extraction, relevance scoring, and content deduplication across live news feeds — delivering structured summaries at scale.
- Applied advanced prompt engineering (chain-of-thought reasoning, few-shot examples, output constraints) for hallucination-resistant responses; A/B testing measured model quality improvements before full rollout.
- Integrated GitHub Actions CI/CD with full SDLC ownership from design to production; OpenTelemetry instrumentation provided end-to-end tracing across Azure and GCP services.

SKILLS

Languages & Backend: Java 11/17, Python, JavaScript, TypeScript, SQL | Spring Boot, Spring Cloud, RESTful APIs, JPA/Hibernate, Apache Kafka, Maven, Gradle, Next.js, React

Testing & Quality: JUnit 5, TDD/BDD, Integration & Regression Testing, SonarQube, Secure Coding (OWASP), JWT/OAuth2, RBAC, Data Privacy

DevOps & Cloud: Docker, Kubernetes (AKS), Jenkins, CI/CD Pipelines, Feature Flags, Azure (DevOps, Monitor, App Insights), AWS (S3, Lambda, RDS), GCP (BigQuery, Dataflow, Pub/Sub, Cloud Storage), Git, GitHub Actions

AI / GenAI: LLM API Integration, Prompt Engineering, NLP Pipelines, GenAI Workflow Automation, ETL/ELT Pipeline Design, TensorFlow, Keras, A/B Model Testing

Practices: Agile/Scrum, Full SDLC, Microservices Design Patterns, Distributed Systems, Scalability, Observability (Prometheus, Grafana, OpenTelemetry), Event-Driven Architecture (Kafka)
